Frozen Food Storage Units

Not Always Adequate for Best Results in Home Quick Freezing

Lenora A. Hull

A user of one of these units de- clared that he found it was far more expensive than he anticipated, even at a commercial locker plant.

If he started it in the spring, he would have to wait until June or July to freeze food. By this time the weather was so hot that he found it was necessary to keep the unit running all day and through the night.

The increasing popularity of frozen foods brought about a need for a clearer understanding of the needs of the family, is satisfactory. If the freezing space as such is provided, these units may be used for freezing only very small quantities of food products and then by placing these in small containers against the cabinet side walls.

Effect of Lygus Bug Injury on The Growth of Alfalfa Subject of Laboratory and Field Study

The yield per acre of alfalfa seed is largely dependent upon the conditions of the plant during blooming. Pattern of pollination, undervisability, moisture relationships, adveart temperature, and relative humidity are all contributing factors in the reduction of the alfalfa seed yield. Even in 1939 and 1939, experimental studies showed that bugs belonging to the genus Lygus were an important factor in causing flower drop of alfalfa.

In the usual type of freezing plant it actually requires less time to freeze and then purchase a commercial locker plant. It would be more advantageous to freeze and then purchase a commercial locker plant.

Foods should be properly prepared, packaged, and stowed in freezer to obtain maximum results. If only the first two uses are of interest to the operator, a smaller freezer of four cubic feet or less is the answer. If the needs of the family, is satisfactory. If so freezing as such is provided, these units may be used for freezing only very small quantities of food products and then by placing these in small containers against the cabinet side walls.
