NEW PUBLICATIONS

-now ready for distribution-

Single copies of these publications—except Manuals and bookson ordering of Agricultural Publications may be obtained without charge from the local office of the Farm Advisor or by addressing a request to Agricultural Publications, 207 University Hall, University of California, Berkeley 4, California. Make checks payable to The Regents of the University of California.

CHEMICALS AND THE FOOD INDUSTRY, by Robert M. Ikeda and Donald G. Crosby, Manual 26 ($1.00).

producers separate as much as 10% of the distillate as heads. While this fraction contains impurities in amounts many times higher than remain in the brandy, alcohol is still the main compound of heads. Recovery of this alcohol in usable form has been a processing problem in the wine industry.

Processes such as redistillation and chemical treatment have been used, but generally are expensive or ineffective. Knowledge of the basic reactions taking place during alcoholic fermentation made it possible to predict that yeast would reduce aldehydic impurities added to fermentation. This was soon demonstrated in the laboratory. Further studies worked out proper conditions including the best time for addition to fermentations and optimum levels for effective reduction of the impurities with minimum toxic effect to fermentations. All the tested species and strains of fermentative yeast reduced impurities.—James F. Guymon, Dept. of Viticulture and Enology, Davis.

Improved strain of HONEYBEES

The development of better bees—more efficient pollinators for California agriculture—is the subject of a current research program. The breeding of improved honeybees requires application of proper breeding techniques, thorough knowledge of the bee and beekeeping, and the development of special beekeeping methods. In addition, the mating of the queen must be controlled by artificial insemination, environmental influence must be minimized, and special techniques must be employed to measure the characteristics of the honeybee colony. The studies also give attention to general inheritance in the honeybee, to sex and caste determination, development and reproduction, morphology, physiology, ecology, and behavior.

The need for a better bee has become urgent because California agriculture is becoming increasingly dependent upon honeybees for the pollination of insect-pollinated crops. The reasons for this dependence are the widespread use of insecticides which are injurious to wild bees as well as to honeybees, and the clean cultivation and weed-control practices that have reduced the wild flowers which provide the spring and fall honey-flows for wild bee populations. Honeybees, in contrast to wild bees, can be moved from one area to another as needed. They vary in their pollinating efficiency, and the breeding work, so far, indicates selection for pollen gathering is effective.—Harry H. Laidlaw, Dept. of Entomology, Davis.

DONATIONS FOR AGRICULTURAL RESEARCH

Contributions to the University of California, Division of Agricultural Sciences

BERKELEY

Adhesive Products, Inc. ........................................... $75.00
For forest products research
Furniture Manufacturers Association of California .................. $500.00
For forest products research
Horkey-Moore Associates ....................................... $2,400.00
For research on pulping of agricultural residuals
Union Carbide Chemicals Company ............................. $500.00
For research with Sevin for control of insects attacking apples, apricots, pears and strawberries
U. S. Atomic Energy Commission .................................. $12,020.00
For research on modes of entry of strontium into plant roots
U. S. Department of Agriculture .................................. $15,000.00
For an economic analysis of the effects of selected adjustments in California on dairy and feed production

DAVIS

California Marketing Program for Canning Bartlett Pears ................ $6,000.00
For research on various factors that influence the flavor quality of Bartlett pear puree or concentrate
Jensen-Salsbery Laboratories, Inc. .................................. $2,500.00
For the pharmacological study of Dimefline
Monsanto Chemical Company ..................................... $750.00
For an investigation of the herbicidal action of chemical compounds supplied by Monsanto Chemical Company
U. S. Army ....................................................... $79,000.00
For investigation on transfers of energy

U. S. Department of Agriculture
For designing, constructing, and testing an experimental egg cleaner (first payment on a total of $70,000.00) .................. $10,000.00
For research on gastroenteritis-complex of swine ................ $7,000.00
For research on the production of domestic rabbits for meat, fur, and wool ........................................... $4,000.00
U. S. Public Health Service
For research on heat transfer and fluid flow of liquid food products ............................................................... $12,400.00
For purchase of a centrifuge ........................................... $26,499.00
For a comparative study of pectic enzymes ....................... $6,597.00
For research on volatiles in spice and condiment oils ........ $13,213.00
For research on manganese deficiency and embryonic development ....................................................... $6,925.06

LOS ANGELES

U. S. Atomic Energy Commission .................................. $11,450.00
For research on the metabolic control of salt transport in plant tissue

RIVERSIDE

Niagara Chemical .................................................. $3,750.00
For studies with Thiadan
Union Carbide Chemicals Company ............................. $7,500.00
For investigations with Sevin on citrus
West End Chemical Company ................................... $500.00
Division of Stauffer Chemical Co.
For research on air pollution
World Health Organization ....................................... $18,000.00
For research on insecticides effective against resistant insect vectors
